

ERD Explanation

EVENT_TYPE-----> EVENT

One type of event can be used for many events, but each event can have one event type, for example Race Day could have a Marathon in Pretoria as an event, the event type is Marathon, other event types could be Sprint or even Jogging.

EVENT-----> CATEGORY

An event can be the actual Race Day that is being organized and the categories could be the different age groups participating such as age group 18-26.

CATEGORY----->ENROLLMENT

This is going to describe the category entered by the participants. Each enrollment is linked to a category; now the system will know which category a particular participant is entered in.

USER-----> EVENT

User covers both the organizer and the participant. So the organizer can organize an event called Race Day. One user can be connected to many events, but each event has one organizer.

USER-----> ENROLLMENT

User covers both the organizer and the participant, in this case we are talking about the participant. A user can enter or register for different. Enrollment is our bridge entity. This means a participant can have many enrollments, but each enrollment belongs to one participant.

EVENT-----> ENROLLMENT

An event can have many participants, and each participant's entry is recorded as an enrollment.

ENROLLMENT-----> RESULT

A participant can be enrolled but not have a result because they haven't finished the race or it hasn't happened yet. That said one enrollment can have zero or one result.
